1. Visually determine the approximate NDVI value of the N Rich-Strip (NRS) and the Farmer Practice (FP).
2. Divide the NRS NDVI by the FP NDVI, this value is the Response Index (RI). The RI is on the right hand side of each graph.
3. Using the graph which best estimates the number of days where GDD>0 for the field, choose the line that is the closest to the RI calculated, and then find the point on that line for the NDVI value nearest to that of the FP. Where the NDVI of the FP and the line intersect is the recommended N rate for that field at that moment.
